REDESIGN BLOCK TOYS USING GENEVA/EMOTION WHEEL

N Rauf, A Padli, D Lantara, DW Thamsoyl

Industrial Engineering Department, Universitas Mulia Indonesia, Makassar, Indonesia,
n.rauf@unma.ac.id, a.padli@unma.ac.id, d.lantara@unma.ac.id, dw.thamsoyl@unma.ac.id

Abstract-This product redesign uses the Geneva emotion wheel (GEW) method to determine the values of respondents' emotions towards toy block products before and after redesign. The results of the Geneva emotion wheel assessment conducted before product redesign on positive emotions are lower than negative emotions, namely 2.22 on positive emotions and 3.77 on negative emotions. It was concluded that respondents gave suggestions related to block toys for improvement. After the improvements were made, the assessment results were 3.83 on positive emotions and 1.55 on negative emotions. These results show the value of user experience that increases between the initial design and redesign. In addition, the results of the improvement design design based on the suggestions given by respondents with the appearance of toys that tend to be bright but not dazzling, namely pastel and natural colours, measuring 18 x 18 x 16 cm.

Keywords: Redesign, Block Toys, User Experience, GEW, Ergonomic

1. INTRODUCTION

Children experience physical, intellectual, social and emotional growth and development from an early age. At this stage, stimulation is needed for children's growth and development to develop maturely. However, in this era of technological advances, children's motor development tends not to be optimally stimulated. Currently, children are exposed to a lot of technology in the form of using gadgets, most of which only provide cognitive stimulation, so that they do not hone their motor development [1]. Motor development in children

includes gross and fine motor skills. Fine motor development is a movement using fine muscle muscles that coordinate with the brain in carrying out activities. This fine motor movement only involves certain parts and is carried out by fine muscle muscles, such as skills involving coordination of eye and finger movements [2]. One form of play that can be used to improve children's fine motor skills is to use block toys. Montessori block toys are a type of wooden chunk game that is popular among children. The chunks can be arranged into any model according to the child's creativity. With this game, nerve coordination, fine muscles will be trained, so that finger movements are more skillful in various activities [3].

The use of educational game tools is widely found in Early Childhood Education (ECE) schools. From the observations made at Makassar Montessori School, it is known that the lack of enthusiasm when children play Montessori blocks is because this game has not provided a good user experience for users. User experience in this case is defined by ISO 9241-210 as a person's perception and response resulting from the use of a product, system or service that includes all emotions, beliefs, choices, physical responses, psychology and user behaviour before, during and after use [4].

Products that can cause a good user experience must be the ones that will be liked by users so that the user experience assessment is considered very important because of the emotional connection with a product [5]. Emotions play a role in the decision making that a person makes towards a product [6]. In addition, the results of market research also show that very few consumers make decisions purely

Remove the abstract, title and journal name in the title of the paper (GENEVA)

based on the function of a product [7]. The involvement of consumer emotions and feelings in the selection of a product should be taken into consideration for designers when designing a product. Consumers will choose a product if the impression that consumers want to feel is on the product [8].

The majority of users make decisions using their thoughts and emotions, so assessing emotional reactions is critical to understanding how to improve interactions when designing a product to create a positive user experience [9]. There are several methods that can be used to measure user experience, one of which is the Geneva Emotion Wheel (GEW). Therefore, looking at the existing problems, it is very important to conduct research and redesign Montessori block toy products using the Geneva Emotion Wheel (GEW) method so as to create a positive experience for consumers.

2. RESEARCH METHOD

The research method used to redesign Montessori block toys in this study is the Geneva emotion wheel method. Geneva Emotion Wheel, is a method used to determine the respondents' emotional response to a product [10]. Emotion in this case is defined as multi-component which includes subjective, reactionary judgement in preparing for action and expression, tendency of one's action, and regulation [11]. Products can evoke a wide range of emotions [12]. The expression of these emotions and feelings will create a feel, impression, like, comfort when consumers choose a product [13].

The Geneva Emotion Wheel divides emotions into 20 emotions (ten positive emotions and ten negative emotions). Emotions are arranged systematically in a circle to form a wheel based on two axes, namely valence (negative and positive) and control (high control and low control) [14, 15]. The two axes divide emotions into four quadrants namely, negative or high control and positive or low control [5]. Each quadrant contains 5 types of emotions based on the quadrant type as can be seen in the figure below. The Geneva Emotion Wheel

(GEW) method has a 5-point scale (neutral scales are also counted). The circular scale gives the respondent an overview of all the emotions felt as well as their intensity [16]

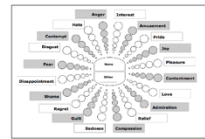

Figure 1. Geneva Emotion Wheel (GEW)

With the emotion graph, respondents can fill in the emotions felt in levels of intensity from low (centre of the circle) to high (to the edge of the circle). In addition, in the centre there is also a choice of neutral emotions, and other emotions. There are three ways of filling in the GEW [14]:

1. Respondents choose only one emotion. If there is no emotion felt, the respondent can choose none, while if there is another emotion that is completely different from the 20 existing emotions, the respondent can fill in the other column.
2. Respondents selected some mixed emotions. The emotions felt are sometimes a mixture of several emotions so respondents are asked to provide intensity for some of the emotions felt. Similar to the first method, if there are no emotions felt, the respondent can select "none" while if there are other emotions that are very different from the 20 emotions, the respondent can fill in the "other" column.
3. Respondents are required to rate the 20 existing emotions in this alternative respondents are required to provide an assessment of the intensity of the 20 existing emotions even though the intensity of the emotion felt is very small.

In this research, the third approach is used with the aim of getting as much emotional description as possible from product users and at the same time opening up opportunities if there are some

emotions that cannot be felt by users [17]. Data collection was conducted directly using purposive sampling method. It began with in-depth observations related to respondents' emotional responses to Montessori block toy products. This method uses criteria that have been determined by the researcher to select samples based on certain considerations [18]. The process was carried out by distributing questionnaires to the teaching staff of the Makassar Montessori School who met the criteria, namely 15 respondents out of 16 teaching staff at the Makassar Montessori School. The questionnaire was distributed twice, namely:

- a. Distribution of the GEW questionnaire before the design of the Montessori block toy design
- b. Distribution of GEW questionnaires after the design of Montessori block toy designs

3. RESULTS AND DISCUSSION

The following is the initial design of a block toy with design specifications that will be the parameters of this research

Figure 2. Block toy before redesigning
The questionnaire test was carried out on respondents who had filled out the

questionnaire. Based on the number of respondents, it is known that the t table for this validity test is 0.514 obtained from the t-table with N = 15 and alpha = 0.05 (two-way test). So every item that successfully has a calculated t value above 0.514 can be said to be valid [19]. Twenty emotions that have been valid then go through the next stage, namely the reliability test by calculating the Cronbach's Alpha value. The questionnaire is said to be reliable or reliable if the Cronbach's alpha value is more than 0.6 where the twenty emotions are declared reliable with a Cronbach's alpha of 0.926 (more than 0.6). This data processing was carried out using spss 26.0 software. The next stage respondents were asked to assess the product before improvement and the average results of 20 emotions including 10 positive emotions and 10 negative emotions can be seen in the table below:

Emotion (+)	Average	Emotion (-)	Average
Fun	3.07	Sadness	3.87
Entertaining	2.93	Guilt	3.93
Proudly	1.80	Regret	3.93
Carefree	2.00	Shame	4.00
Like	3.07	Disappointed	2.20
Satisfaction	1.73	Fear	4.00
Love	1.93	Sick	4.13
Admiration	1.87	Disgusting	3.87
Relieved	2.00	Hate	4.13
Touched	1.80	Angry	3.67

Based on the table of results of the average GEW value above the Montessori block toy product before design on positive emotional data has a lower average value than negative emotional. This indicates that respondents want new innovations from previous products. Then a redesign was carried out to increase the value of user experience on Montessori block toy products. This product design is designed based on data processing and in accordance with the suggestions that have been given by respondents. The results of respondents' suggestions for product assessment then formed 3 different concepts. The design results can be seen as follows:

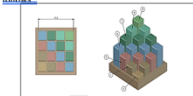

Figure 3. Block Toy Blocks Model A

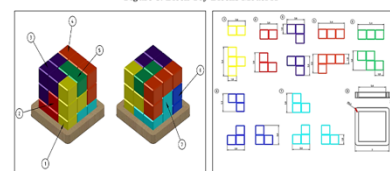

Figure 4. Block Toy Blocks Model B

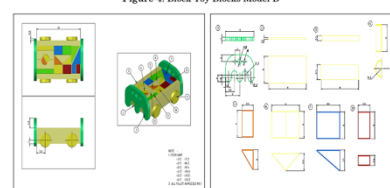

Figure 5. Block Toy Blocks Model B

Design selection was carried out by distributing questionnaires to the same respondents in the first GEW questionnaire with a total of 15 people. This questionnaire only displays a visual design for design selection where respondents can choose the desired block toy design. The results of the questionnaire as can be seen in the following figure

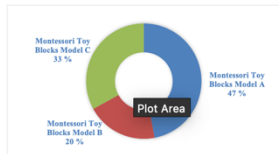

Figure 6. Block Toy Blocks Model C

The data shown in the graph above is that of the 15 respondents, 47% of respondents liked the design of the toy block model A, 29% of respondents liked the design of the toy block model B and 33% of

respondents liked the design of the toy block model C. So the selected design is the design of the toy block model A with the following specifications.

Table 2. Product Specifications

No.	Component	Total	Material
1.	Container Base	1	MDF Wood
2.	Container Side	4	Pine Wood
3.	Beam 1	1	Pine Wood
4.	Beam 2	2	Pine Wood
5.	Beam 3	3	Pine Wood
6.	Beam 4	4	Pine Wood
7.	Beam 5	5	Pine Wood
8.	Beam 6	2	Pine Wood
9.	Beam 7	1	Pine Wood

From the results of the questionnaire identification, the Montessori block toy model A was chosen as the most popular block toy by respondents with toy specifications with a rectangular block shape of 16 pieces with varying sizes measuring 18 x 18 x 16 cm so as to make the toy sturdy when arranged and made with a simple shape but the game mode can be developed by children according to their creativity. The use of color is an important element in the design of this toy. This is because the presence of color will be a special attraction for children [20]. The choice of color that tend

to be bright but not dazzling is one of the considerations so as not to make children's eyes easily tired [21]. In addition, the use of colors in block toys no longer uses basic colors because it adapts to the age stage of children, namely 5-6 years old where at that age children need to be introduced to secondary and tertiary colors. With the improvements that have been made, it will increase the positive experience of the product. After designing and selecting the product image design. Furthermore, the second GEW questionnaire was assessed and filled in to find

5

out the average value of GEW after the redesign. The distribution of this questionnaire also has similarities with the first GEW questionnaire.

The average results of 20 emotions including 10 positive emotions and 10 negative emotions can be seen in the table below.

Table 3. GEW value after redesign			
Emotion (+)	Average	Emotion (-)	Average
Fun	3,87	Sadness	1,80
Entertaining	3,93	Guilt	1,60
Proudly	3,73	Regret	1,73
Carefree	3,73	Shame	1,60
Like	4,33	Disappointed	1,27
Satisfaction	3,87	Fear	1,67
Love	4,07	Sick	1,40
Admiration	3,87	Disgusting	1,47
Relieved	3,33	Hate	1,53
Touched	3,33	Anxiety	1,47

Based on the results of the normality test output that has been obtained, it shows that the asymp.sig value before the design is 0.171 and the asymp.sig after the design is 0.200, so the average emotion data of the GEW questionnaire before and after design is normally distributed. In accordance with the results of the normality test output that has been obtained, it shows that all data is normally distributed because it has an asymp.sig value > 0.05.

Furthermore, a significance test was conducted to determine whether there was a difference in the average GEW score before and after the product was designed. The method used in this significance test is the paired T test. Based on the results of the paired T test significance test output that has been obtained, the asymp.sig value is 0.000, so the average GEW score data before and after design on positive and negative emotions is significantly different.

Table 4. GEW Value Before & After

Emotions	Before	After	Significance Test
Positive	2,22	3,83	Significantly different
Negative	3,77	1,55	Significantly different

Based on the output of the significance test, it can be concluded that there is a significant difference in negative emotions and positive emotions towards product design before and after being designed.

4. CONCLUSION

From the results of research that has been conducted before product redesign, it can be seen that the positive emotions generated are lower than negative emotions, namely 2.22 on positive emotions and 3.77 on negative emotions. In this

case it can be concluded that the respondents gave suggestions related to Montessori block toys for improvement. After making improvements using the same method, the value obtained on positive emotions is higher than the negative value, namely 3.83 on positive emotions and 1.55 on negative emotions. These results show the value of user experience that increases between the initial design and redesign. In addition, the results of the improvement design design based on the suggestions given by respondents with the appearance of toys that tend to be bright but not dazzling, namely pastel and natural colors measuring 18 x 18 x 16 cm. With

6

a total of 16 blocks and varying sizes. The product has advantages, namely the shape of the toy blocks is sturdy when arranged, multifunctional toys, and can be played individually or in groups.

DECLARATION OF COMPETING INTEREST

Related to the writing of this article, all the authors state that there is no problem of competition between financial and non-financial interests in the material discussed in this paper if any of the authors have any financial and non-financial competing interests they must be declared in this section.

Dear Author,

Paper ID: 1831-240129

Please kindly revise your submitted paper considering the following [Review Comments](#) and resend it again for checking out.

REVIEW COMMENTS:

- Please send your paper according to the IJTPE journal format and the following review comments: www.ijtpc.com/IJTPE/FormatOfPapers.html
- All **used figures, tables and equations** SHOULD BE addressed to the related ORIGINAL references by [] in the end of titles.
- (IMPORTANT) - Address all the used **figures** and **tables** from the related original references in text as well as the titles using [].
- Request **PERMISSION** to use the **figures** and **tables** from related resources.
- (IMPORTANT) - Address all the used **equations** from the related original references.
- If any figure/table/equation is used from a reference then write down the reference number inside [] at the end of the figure/table title and also at the end of the related paragraphs.

- All text bodies must be typed in **two columns** (Single Line Spacing), **Times New Roman 10 pt** and justified from both sides.
- Change the font and size of all the information, **equations and titles** in the **tables, figures and algorithms** to **Times New Roman 8 pt**.
- The paragraphs begin at **one TAB of 0.5 cm** (the Indentation of the first line of paragraphs is 0.5 cm).
- The **figure(s), table(s) and algorithm(s)** should be **simple design, not bordered, not shadowed, not highlighted and not bolded** as well as including **high quality/resolution** contents and **Times New Roman 8 pt - black color**.
- The quality of **Figure(s) 1-5** is not accepted and **should be changed or redrawn** by a high quality graphical tool(s). The quality of the figures in the journal published PDF format will be poor. Use the origin images with a qualitative resolution of **High Fidelity**.
- Use **DECIMAL POINT "."** instead of **COMMA ","** in the decimal presentation of the numbers, e.g. "0.2" instead of "0,2", in the whole of the paper contents, figures and tables.

Please kindly revise your submitted paper considering the following *Review Comments* and resend it again for checking out.

REVIEW COMMENTS:

- Please send your paper according to the IJTPE journal format and the following review comments:

www.iotpe.com/IJTPE/FormatOfPapers.html

- All **used figures, tables and equations** SHOULD BE addressed to the related ORIGINAL references by [] in the end of titles.

- (IMPORTANT) - Address all the used **figures** and **tables** from the related original references in text as well as the titles using [].

- Request **PERMISSION** to use the **figures** and **tables** from related resources.

- (IMPORTANT) - Address all the used **equations** from the related original references.

- If any figure/table/equation is used from a reference then write down the reference number inside [] at the end of the figure/table title and also at the end of the related paragraphs.

- All text bodies must be typed in *two columns* (Single Line Spacing), **Times New Roman 10 pt** and justified from both sides.

- Change the font and size of all the information, *equations and titles* in the *tables, figures and algorithms* to **Times New Roman 8 pt**.

- The paragraphs begin at *one TAB of 0.5 cm* (the Indentation of the first line of paragraphs is 0.5 cm).

- The **figure(s), table(s) and algorithm(s)** should be **simple design, not bordered, not shadowed, not highlighted** and **not bolded** as well as including *high quality/resolution* contents and **Times New Roman 8 pt - black color**.

- The quality of **Figure(s) 1-5** is not accepted and **should be changed or redrawn** by a high quality graphical tool(s). The quality of the figures in the journal published PDF format will be poor. Use the origin images with a qualitative resolution of **High Fidelity**.

- Use **DECIMAL POINT “.”** instead of **COMMA “,”** in the decimal presentation of the numbers, e.g. “0.2” instead of “0,2”, in the whole of the paper contents, figures and tables.

REFERENCES:

- Rearrange and complete the References according to IJTPE Journal format as Name (first word) Surname, ..., (WITHOUT AND) “Paper or Book Title”, Proceeding or Journal or Publication (**COMPLETE NAME**), Issue ..., Vol. ..., No. ..., pp. ...-..., Place, City, Country, Date/Year, *WITHOUT WEB ADDRESS, WITHOUT DOI*.

- Assign the name and surname of the authors exactly according to the references format of the journal.

Example:

[1] A.B. Cdef, G. Hijk, L.M.N. Opqr, et al., “The Title of the Paper or Book or Thesis or Report”, Conference of Abcd, Journal of Efgh, Issue 1, Vol. 2, No. 3, pp. 4-10, City, Country, April 2021.

- Use and address at least two references in your paper from the previously accepted papers in IJTPE journal issues published in the address <http://www.iotpe.com/IJTPE/IJTPE-JournalIssues.html>.

BIOGRAPHIES:

- Include the photo(s) of the author(s) with high quality and color based in the Biographies section. The photos should be in high resolution, color status, white background (*without any logo, flag, etc.*) and size of 2.5 cm x 2 cm. Taken in full-face view directly facing the camera (*without glass, etc.*).

Resolution: **High Fidelity**.

- Fill out the items of the following form for **the 5th author** separately at the end of the paper.

Name:

Middle Name:

Surname:

Birthday: dd.mm.yyyy

Birthplace: City, Country

Bachelor: Field/Title, Department, Faculty, University/Institute, City, Country, Year of Graduation

Master: Field/Title, Department, Faculty, University/Institute, City, Country, Year of Graduation

Master: **Student**, Field/Title, Department, Faculty, University/Institute, City, Country, **Since Year**

(if the author is a Master student)

Doctorate: Field/Title, Department, Faculty, University/Institute, City, Country, Year of Graduation

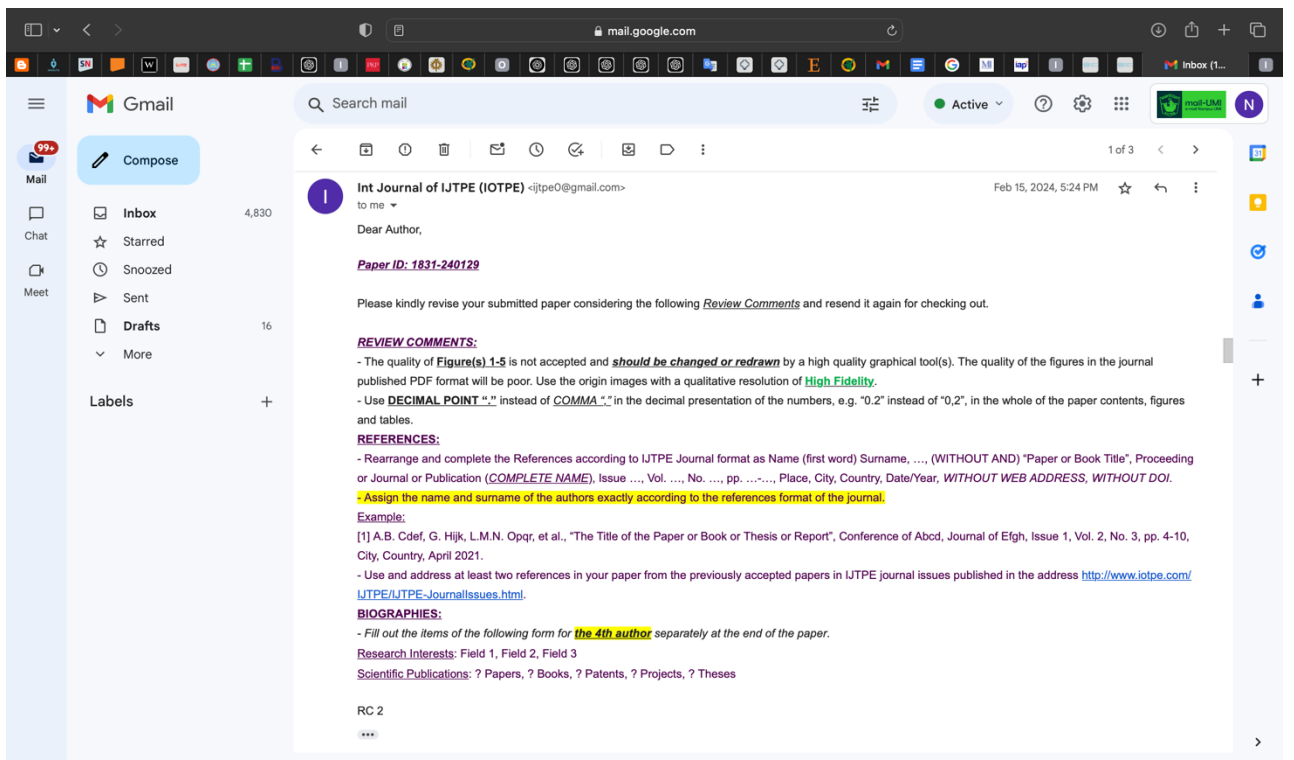

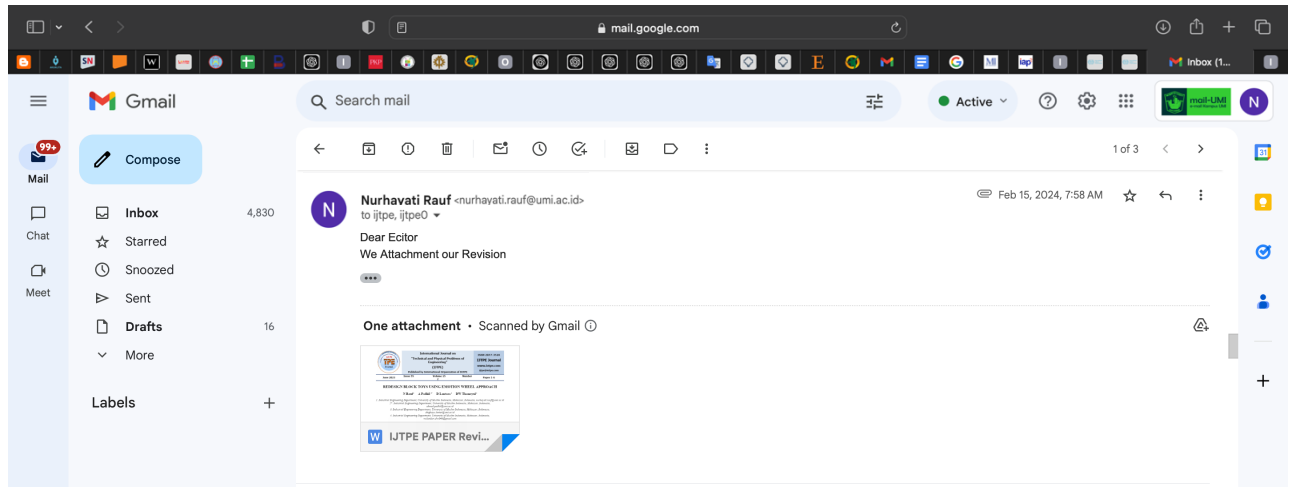

Doctorate: **Student**, Field/Title, Department, Faculty, University/Institute, City, Country, **Since Year**

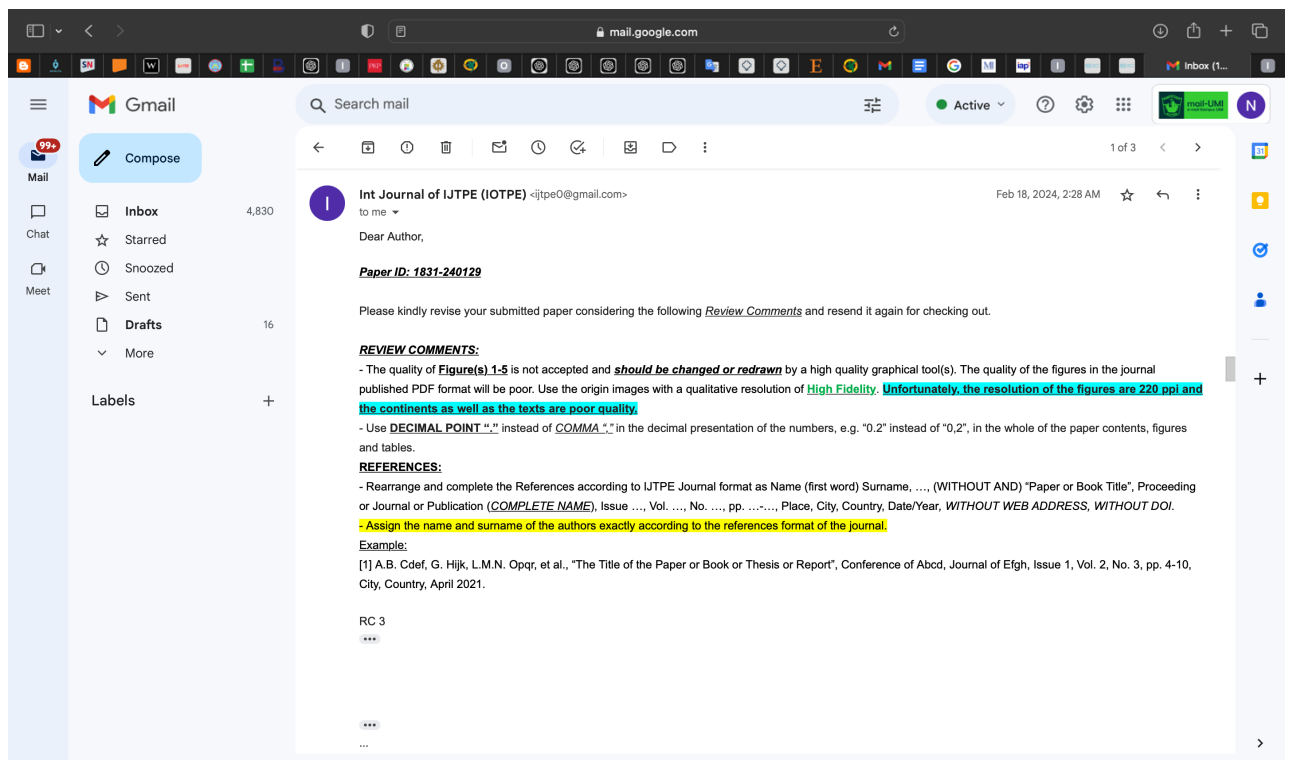

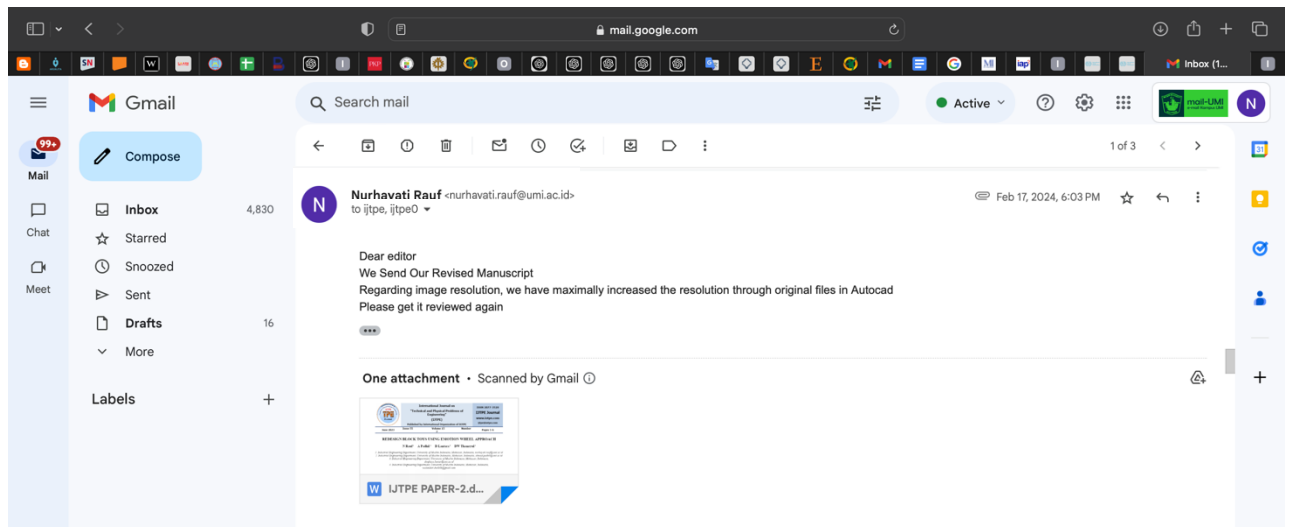

(if the author is a Doctorate student)

The Last Scientific Position: Academic/Prof./Assoc. Prof./Assist. Prof./Lecturer, Department, Faculty, University/Institute, City, Country, **Since Year**

Research Interests: Field 1 Field 2 Field 3

Dear editor
We Send Our Revised Manuscript
Regarding image resolution, we have maximally increased the resolution through original files in Autocad
Please get it reviewed again

Int Journal of IJTPE (IJTPE) <jltpe0@gmail.com> to me

Feb 19, 2024, 3:09 PM

Dear Author,

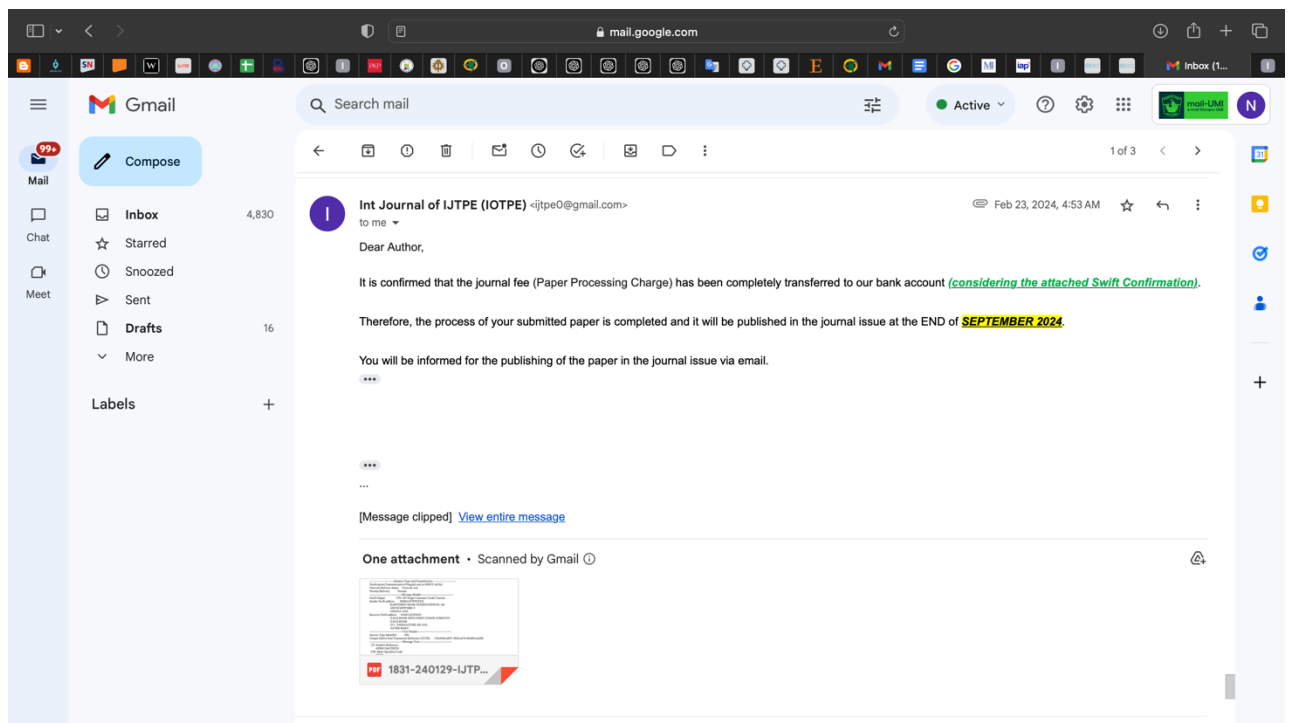

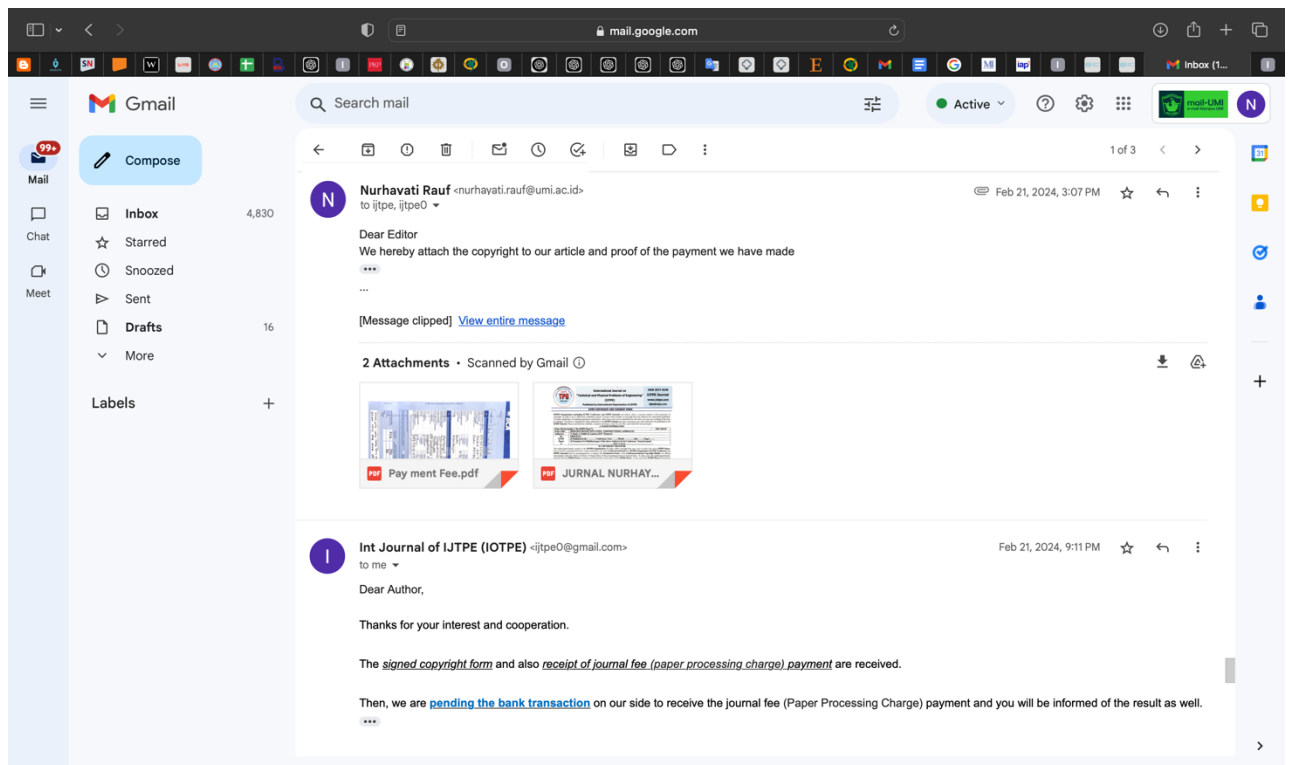

The submitted paper **will be reserved for the journal issue at the End of SEPTEMBER 2024** after final review and receiving signed copyright form and also receipt of journal fee (Paper Processing Charge).

The Journal Editorial Board has the right to change the publishing schedule of the accepted paper(s) in the earlier or later issue(s) of the journal based on the publishing planning and limitations.

1. **Please print out and sign the attached Copyright Form by hand and send the scanned file back to us.**
Do not forget to fill in the name and surname of the corresponding author as well as the information of the extended paper published before in another conference or journal.
Digital signature used in the copyright form is not accepted.
2. The indexing databases may index the published papers according to their methods and schedules and the IJTPE Journal does not control the indexing processes of the published papers on the indexing databases. Therefore, the Author(s) has(ve) not any right to claim in this regard.
 - The reviewed and accepted papers are just published in the IJTPE Journal according to the Author(s)' submission, request and transferring the Journal Fee.
 - The Journal Editorial Board has the right to change the publishing schedule of the accepted paper(s) in the earlier or later issue(s) of the journal based on the publishing planning and limitations.
 - The Journal Editorial Board has the right to change the title and contents of the accepted paper(s) before/after the publishing process based on its rules and strategies.
 - **Violation of any part of the Agreement by the Author(s)** will cause the publication of the submitted paper in the IJTPE Journal to be **CANCELLED**.
3. Please also transfer the Journal Fee (Paper Processing Charge) and send the receipt.
<http://www.iotpe.com/IJTPE/JournalFees.html>

- The **Journal Fee** is considered by the Editorial Board to cover the communication, reviewing, editing and publication processes of the submitted papers and **it is not refundable**.

REDESIGN BLOCK TOYS USING EMOTION WHEEL APPROACH

N. Rauf A. Padhil D. Lantara D.W. Thamsyul

Industrial Engineering Department, Indonesian Muslim University, Makassar, Indonesia
 nurhayati.rauf@umi.ac.id, ahmad.padhil@umi.ac.id, dirghayu.lantar@umi.ac.id, wulandari.dwi046@gmail.com

Abstract- The product redesign uses the Emotion Wheel Approach, method to determine the level of emotion of the respondents in relation to toy block products before and after the redesign. The results of the Geneva emotion wheel assessment conducted before product redesign on positive emotions are lower than negative emotions, namely 2.22 on positive emotions and 3.77 on negative emotions. It was concluded that respondents gave suggestions related to block toys for improvement. After the improvements were made, the assessment results were 3.83 on positive emotions and 1.55 on negative emotions. These results show the value of user experience that increases between the initial design and redesign. In addition, the results of the improvement design based on the suggestions given by respondents with the appearance of toys that tend to be bright but not dazzling, namely pastel and natural colors measuring 18×18×16 cm.

Keywords: Redesign, Block Toys, User Experience, GEW, Ergonomic.

1. INTRODUCTION

Children experience physical, intellectual, social and emotional growth and development from an early age. At this stage, stimulation is needed for children's growth and development to develop maturely. However, in this era of technological advances, children's motor development tends not to be optimally stimulated. In help the development of a technological and scientific and culture in order to construct first coherent, rational and global [1]. Currently, children are exposed to a lot of technology in the form of using gadgets, most of which only provide cognitive stimulation, so that they do not hone their motor development [2].

The development of children's motor skills includes gross and fine motor skills. Fine motor development is a movement that uses fine muscles to coordinate with the brain when performing activities. This fine motor movement only involves certain parts and is carried out by fine muscle muscles, such as skills involving coordination of eye and finger movements [3]. A form of play that can be used to improve the ability of children to move is to use blocks of toys. Montessori block toys are a type of wooden chunk game that is popular among children. The chunks can be arranged into any model according to the child's

creativity. With this game, nerve coordination, fine muscles will be trained, so that finger movements are more skillful in various activities [4].

The use of educational game tools is widely found in Early Childhood Education (ECE) schools. From the observations made at Makassar Montessori School, it is known that the lack of enthusiasm when children play Montessori blocks is because this game has not provided a good user experience for users. ISO 9241-210 defines user experience as the perception and reaction of people through the use of products, systems or services that include all emotions, beliefs, choices, physical responses, psychology and user behavior before, during and after use [5]. Products that can cause a good user experience must be the ones that will be liked by users so that the user experience assessment is considered very important because of the emotional connection with a product [6].

Emotions play a role in the decision making that a person makes towards a product [7]. In addition, the results of market research also show that very few consumers make decisions purely based on the function of a product [8]. The involvement of consumer emotions and feelings in the selection of a product should be taken into consideration for designers when designing a product. Consumers will choose a product if the impression that consumers want to feel is on the product [9]. Given the importance of the lesson planning phase as a framework and guide for action and in the continuity of our research project initiated by the analysis [10].

The majority of users make decisions using their thoughts and emotions, so assessing emotional reactions is critical to understanding how to improve interactions when designing a product to create a positive user experience [11]. There are several methods that can be used to measure user experience, one of which is the Geneva Emotion Wheel (GEW). Therefore, looking at the existing problems, it is very important to conduct research and redesign Montessori block toy products using the Geneva Emotion Wheel (GEW) method so as to create a positive experience for consumers.

2. RESEARCH METHOD

The methodology used to redesign Montessori block toys in this study is the Geneva Method of the Emotional Wheel used to determine the respondents' emotional response to a product [12].
